Indonesia

Through the Dutch Fund for Climate and Development (DFCD), SNV is supporting Forest Carbon in developing a Forest and Biodiversity Bond to finance the protection and restoration of over 300,000 hectares of forests and wetlands in Indonesia.

Beyond mobilising investment for biodiversity, the initiative aims to strengthen community benefit-sharing frameworks, ensuring that local and indigenous communities benefit from conservation efforts.

This initiative illustrates how financing mechanisms can be designed to distribute the benefits of biodiversity conservation more equitably, recognising local communities as stakeholders rather than simply beneficiaries of environmental action.
